I am interested in knowing the centrifugal compressor discharge temperature calculations for higher pressure ratios ( $P_{out}/P_{in}$ ), around 3 or more. I was using the below formula, but its not useful for high pressure ratios.  $T_{OUTLET} = T_{INLET} * \{ (P_{DISCHARGE}/P_{INLET})^{((n-1)/n)} \}$  Kindly also help me understanding the limitation of above formula.

Accurate performance measurement of a centrifugal compressor is very dependent upon the quality of the field data. In general, testing should follow the conditions set forth in ASME PTC 10 (1997). Compressor piping should be designed to accommodate flowmeter runs and to meet location requirements for pressure and temperature as well.
