Chapter 12.6 The burden is the sum of all external forces which act on the hydraulic actuator from the physical system. The burden can be expressed as:  $F_b = F_{ext}$  (12-1) where  $F_b$  is the burden, the sum of all external forces ( $F_{ext}$ ). This definition does include terms such as gravity, but does not include inertial terms because inertial terms involve the action of hydraulic pressure.

Another advantage hydraulic-powered machines have over pneumatic ones is that they operate at higher pressure -- typically 1500 to 2500 psi. Higher pressures generate high force from smaller actuators, which means less clutter at the work area. The main disadvantage of hydraulics is increased first cost because a power unit is part of the machine.
